it is known that the lhc has a considerable discovery potential because of its large centre of mass energy vs 14 tev and the high design luminosity in addition the two experiments atlas and cms perform precision measurements for numerous models in physics the increasing experimental precision demands an even higher level of accuracy on the theoretical side for a more precise prediction of outcomes one has to consider the corrections obtained typically from quantum chromodynamics qcd the calculation of these corrections in the high energy regime is described by perturbation theory in the present study multi loop calculations in qcd including in particular two loop corrections

for single top quark production are considered there are several phenomenological motivations to study single top quark production firstly the process is sensitive to the electroweak wtb vertex moreover non standard couplings can hint at physics beyond the standard model secondly the t channel cross section measurement provides information on the b quark parton distribution functions pdf finally single top quark production enables us to directly measure the cabibbo kobayashi maskawa ckm matrix element vtb the next to next to leading order nnlo calculation of the single top quark production has many building blocks in this study two blocks will be presented one loop corrections squared and two loop corrections interfered with born initially the one loop squared contribution at nnlo for single top quark production will be calculated before we begin with the calculation of the two loop corrections to single top quark production we calculate the qcd form factors of heavy quarks at nnlo along with the axial vector coupling as a first independent check a comparison with the relevant literature suggests that this approach is in line with generally accepted procedure this consistency check provides a proof of the validity of our setup in the next step the two loop corrections to single top quark production will be calculated after reducing all occurring tensor integrals to scalar integrals we apply the integration by parts method ibp to find the master integrals this step is a major challenge compared to all similar calculations because of the number of variables in the problem two mandelstam variables s and t the dimension d and the mass of the top quark m_t as well as the mass of the w boson m_w finally the calculation of the three kinds of topologies vertex corrections double boxes and non planar double boxes in the two loop contribution at nnlo calculation will be presented

the book is intended for students of graduate and postgraduate level researchers in mathematical sciences as well as those who want to apply the spectral theory of second order differential operators in exterior domains to their own field in the first half of this book the classical results of spectral and scattering theory the selfadjointness essential spectrum absolute continuity of the continuous spectrum spectral representations short range and long range scattering are summarized in the second half recent results scattering of schrodinger operators on a star graph uniform resolvent estimates smoothing properties and strichartz estimates and some applications are discussed
